

**STARFIGHTER SPACE
COMBAT MANUAL**

WELCOME TO STAR SQUADRON

Starfighters become more than machines of war the instant a pilot enters the cockpit. Together, they fuse into a fearsome force, wielding fantastic energy weapons capable of obliterating cities. The ship's perpetual energy core funnels pure power through ship systems like a gladiator's heart pumps blood through steely muscle. With reflexes honed over years of battle and augmented with myriad advanced technologies, these warriors are capable of feats of combat aeronautics that border on the impossible.

You command a squadron of these impossible warriors. Whether it will be to victory or defeat depends on your tactics, your luck, and your ability to outwit your opponent - an opponent trying to do the same to you. Good luck, Commander.

CONTENTS

1 Double-sided Game Board

Playing surface that represents the worlds of Star Squadron. The difference between sides is purely thematic. They measure 20 x 29 full hexes.

5 Double-sided Terrain Tiles

Tiles that are placed on the game board before playing. They have various effects when moved over as described later in this manual.

6 Ship Minis with Stands

Playing pieces representing the various fighter craft of Star Squadron aka "ships". While playing, the nose of a ship should always point the direction it is flying.

12 Six-Sided Dice

If a game effect refers to dice or a roll, use these to determine the outcome.

2 Screens

Each player uses a screen to hide their flight control panel from their opponents. It also has a handy gameplay guide.

2 Flight Control Panels & 6 Ship Maneuver Tokens

Each player places their corresponding ship maneuver tokens on their flight control panels to plan the maneuvers their squadron will take in the coming action phase.

Faction Ability Cards & Ability/Equipment Tokens

Some game modes use additional, faction-specific abilities and tokens. These cards explain those abilities and tokens.

24 Plastic Cubes

These cubes are used to track various ship energy (⚡) levels, as well as Hull Points (🛡️ or HP for short). Slide them left to reduce a meter, and right to increase it.

Objective Tokens

Several game objectives use these tokens to track important information, such as Victory Points (🏆) or VP for short). Objectives are explained later in this manual.

Various Cards

The 8 pilot cards, 6 ship cards, and 9 special weapon cards combine with the 6 dual-layer ship boards to create starfighters, as shown on the next page.

Accuracy (☒☒☒)

The pilot's ability to shoot a target at a given range. From left to right, they are short, medium, and long range. Lower accuracy numbers mean more damage when firing.

Skill (☒☒☒)

How efficiently a pilot maneuvers their ship. Pilots with lower skill numbers are better at conserving energy while dogfighting.

Evasion (☒☒☒)

The pilot's ability to predict and dodge incoming enemy fire. By jinking and rolling, a pilot with a lower evasion number will take less damage from enemy attacks.

Card Name, Faction, & Type

Pilot Ability

Only used in some game modes, each pilot has a unique ability on one side of their card.

Special Maneuver

Each pilot knows a maneuver available only to them. These often push a starfighter to its limits for a tactical advantage.

Card Name, Faction, & Type

Main Blasters

All ships come equipped with onboard weaponry, which is described here. For more info, see ATTACKING, later in this manual.

Ship Ability

In some game modes, ships may gain special abilities and tokens that will be listed here. They are described in more detail on the faction ability card.

Maneuver Cost(s)

Different starfighters perform better at different maneuvers speeds, shown here in order of: slow (☒), standard (☒☒), and fast (☒☒☒). The higher the cost, the more energy a maneuver of the corresponding speed will likely cost.

Starting HP (☒☒☒)

Short for Hull Points. The higher a ship's HP, the more damage it can take before being destroyed. Higher ☒☒☒ (HP) often comes at the cost of better maneuverability or loadouts.

SHIP BOARD

Ship Card

Place the ship card here.

Special Weapon Card Slot

Choose a special weapon for this ship and place it here.

Pilot Card Slot

Place the pilot card here.

Boost Energy (⚡) System Meter

Tracks the current level of the ⚡ that powers the thrusters used to maneuver the ship.

Weapon Energy (⚡) System Meter

Tracks the current ⚡ that can be spent to fire the Main Blasters and Special Weapon of the ship.

HP (🛡️) Meter

Short for Hull Points. Track the current level of the ship's 🛡️ here.

Shield Energy (⚡) System Meter

Tracks the current ⚡ level of the protective deflector shield enveloping the ship.

SET UP

When making your own layout, it is recommended that it be symmetrical along the longer axis of the board. Terrain tiles should block direct paths between opposing ship's starting spaces. If both players agree, you can mix and match terrain types or use one of the terrain variant rules later in this book.

1. The players jointly select a layout from those shown here, or create their own together (see sidebar).
2. Players jointly choose a terrain type. Take 1 large and 4 small tiles that match the chosen type and place them according to the layout. (For assistance, the green lines mark the center row and column of the board.)
3. The players jointly choose an objective for the mission from those at the end of this manual. This will determine the end conditions of the game, as well as how it is won or lost. If the objective has any special setup instructions, perform them now.
4. Each player chooses a faction and assembles their squadron of ships: in each of three ship boards, that player combines a ship card from their faction, a pilot card from their faction, and any special weapon card (they are not faction specific) as seen on the previous page. Be sure to place ship cards

with the “Heavy Armor” side face-up and pilot cards with the side **WITHOUT** ability text face-up. (See the sidebar for how to use the other sides.)

5. Place a plastic cube in each ship’s matching-color energy (⚡) system meter, setting them to maximum ⚡ (5). Place a dark plastic cube in each ships’ HP (🛡️) meter, and set it to that ship’s starting 🛡️, as shown on its ship card.

6. Each player grabs the miniatures matching their ships and places one (on a ship stand) in each of the starting spaces along one side of the map (according to the chosen layout) while their opponent does the same along the opposite side. Each ship’s orientation must match their starting space’s arrow as shown.

7. Each player takes a screen, a control panel, and the maneuver tokens matching their ships. Place the dice and terrain rules card within reach of both players. Now you’re ready to play!

This setup is for the symmetrical game mode. For asymmetrical and other game modes, see **GAME MODES**, later in this manual. Some of these game modes use the other sides of the pilot and ship cards.

GAMEDSIGN BY PATRICK PETERSEN / ILLUSTRATION AND GRAPHIC DESIGN BY LUCA MOOS

PLAYING THE GAME

Games of Star Squadron are designed to replicate lightning-fast starfighter dogfights in strange cosmic locales. They are quick, violent, and spectacular. In this chapter, you will learn the overall flow of the game (Rounds, Phases, and Steps), how to plan, power, and perform your ship's aeronautic maneuvers (Maneuvering) and, possibly most exciting of all, how to devastate your foes with an arsenal of fearsome energy weaponry (Attacking).

To simulate these high-octane battles, several phases are (or can be) performed simultaneously with your opponent. You will not be reacting to your enemy - you will be actively trying to predict their tactics and directly counteract them. Don't be predictable! That's a one-way ticket to defeat.

ROUNDS, PHASES, + STEPS

Star Squadron is played over a series of rounds. Rounds are divided into 3 phases: the tactics phase, the action phase, and the recharge phase. The action phase is broken up into 3 steps, which must be completed in order. Once all the phases have been completed, a new round is started. Rounds continue until the end condition of the chosen objective is achieved, at which point winners and losers are immediately declared and the game is over.

TACTICS PHASE

In this phase, players secretly plan their maneuvers and seek to outwit their opponent:

First, each player conceals their flight control panel with their screen.

Then, for each ship, its controlling player places the corresponding ship maneuver token on any maneuver on their flight control panel - this is the maneuver that ship will perform in the next phase. The same maneuver may be chosen by multiple ships.

Finally, once all maneuvers have been chosen, the players reveal their flight control panels by lowering their screen and setting them aside.

This player wants their interceptor to perform a Bank Right 5 maneuver in the upcoming action phase. So they place the maneuver token that matches their interceptor on the Bank Right 5 maneuver space of the flight control panel.

ACTION PHASE

In this phase, players resolve their chosen maneuvers and fire devastating attacks on each other.

- 1. Maneuver Step:** Simultaneously, the players perform the selected maneuvers for each of their ships, exactly as shown on the flight control panel. Performing a maneuver consists of paying for the maneuver and moving its miniature. See MANEUVERING, later in this manual.
- 2. Attack Step:** The players each roll a dice. Whoever rolls higher (reroll ties) chooses a ship they control to make any number of attacks. Then the other player chooses one. The players do this back-and-forth until they both cannot, or choose not to, make any more attacks. See ATTACKING, later in this manual.
- 3. Destroy Step:** All ships with zero HP (☒) are destroyed. When a ship is destroyed, remove its miniature, ship board, cards, and tokens from the game. They are no longer part of the game. Any of your opponent's tokens on or beside that ship are returned.

RECHARGE PHASE

In this phase, players make difficult decisions about how to direct their ships power.

Simultaneously, each ship recharges three total energy (⚡⚡⚡). For each recharging ⚡, the player controlling that ship increases one of that ship's three energy systems by one ⚡. If all three systems are at maximum (5), any remaining recharge ⚡ is lost.

Sometimes a player may wish to see how their opponent recharges before they decide how to. In this case, each player rolls a dice. Whoever rolls higher (reroll ties) recharges a ship first, then the players go back and forth recharging ships until all ships have been recharged.

MANEUVERING

Ship wheel and careen in a deadly dance, channeling huge amounts of power through massive engines. The pilot who outwits their opponent and finds the superior angle of attack will surely take victory.

Performing a maneuver consists of two parts: paying the maneuver cost, and moving the ship miniature. Each maneuver has a speed: slow (➤), standard (➤➤), or fast (➤➤➤), as shown on the control panel. For each speed, there is a corresponding maneuver cost on the ship's card. To pay this maneuver cost, roll that many dice. Each die that rolls lower than the maneuvering ship's skill (⚙️) reduces that ship's boost energy (⚡) by 1.

After paying for a ship's maneuver, move that ship miniature exactly as shown in the selected maneuver's diagram. The light hex with a dark arrow shows the ships starting hex and orientation, the dark hex with a light arrow shows the final hex and orientation. The ship moves through every hex along the way. If a ship moves off the board or onto one of the half-hexes along the border of the game board, it is immediately destroyed (do not wait for the destroy step). Ships may freely move through other ships and may even share hexes. In this case, it helps to replace one of the ships with its maneuver token and use its miniature on the command board until they no longer share a space.

Each pilot has access to one or two special maneuvers, as shown on their card. These can be performed by selecting the matching "PILOT SPECIAL" space on the control panel (pilots with only one special maneuver can use either space). Special maneuvers do not have a speed; when paying for one, roll a number of dice equal to the number shown by the special maneuver.

If the energy (⚡) in a ship's system would ever go below zero, that ship loses HP (🩹) equal to the difference.

In addition, if it is the boost system going below zero, they "flame-out". When a ship flames-out, it will automatically select and perform the "ahead 4" maneuver (labeled FLAME-OUT on the control board) in the next round and no others. Keep the ship's maneuver token, "FLAME-OUT" side up, next to its miniature as a reminder to you and your opponent. When performed this way, the maneuver has a cost of zero.

In the example to the right, the superiority fighter has chosen to perform a bank left 5 maneuver (a).

The player notes that maneuver is a standard (»») maneuver on the control board (b). The player references the »» maneuver cost on the maneuvering ship's card (c) which is 3. The player then rolls that many dice and compares them to the maneuvering pilot's skill (»») (d), which is a 4+. The player rolled a 1, 2, and 3. Only the 1 is lower than the pilot's »», so the player reduces the maneuvering ship's boost ⚡ by one.

Then the superiority fighter moves forward 3 hexes, rotates 60 degrees to the left, and continues another 2 hex, for a total of 5 hexes of movement.

In the example to the left, the interceptor has chosen to perform its pilot's special maneuver: the inside loop aka "Loop" (a).

The loop has a static maneuver cost of 4 (b). So, the player rolls 4 dice and all of them roll lower than the pilot's skill (»»). The ship only has 2 boost energy (⚡) currently, so it loses 2 HP (🔥) and places its maneuver token, "FLAME-OUT" side up (c), next to its miniature.

Then the interceptor moves backward 1 hex, while maintaining its orientation, simulating performing a spectacular loop-de-loop. Let's hope it was worth flaming-out for!

ATTACKING

The time for tactics has passed, now the pilots that have opponents in their sights pull their triggers and fire off all manner of spectacular weapons.

Each attack follows this sequence:

1. **Target Enemy** (arc, range, LOS)
2. **Pay ⚡ cost**
3. **Attacker Rolls**  ( x  = hits)
4. **Target Rolls**  (Hits x  = damage)
5. **Deal damage**

Target Enemy: To make an attack, a ship chooses Main Blasters or its Special Weapon and an enemy ship it can target. An enemy can be targeted if it is within the chosen weapon's:

1. Firing arc, relative to the attacking ship (see right).
2. Short, medium, or long range.
3. Line-of-Sight (LOS).

To determine LOS, draw an imaginary line from the center of the attacking miniature's hex to the center of the target ship's. If this line does not cross any terrain tiles then the target is within LOS. If it goes exactly along the edge, LOS is not blocked.

Pay energy (⚡) Cost: In order to fire a weapon, a ship must first spend one weapon ⚡ for each "⚡" symbol in the chosen weapon's profile. A ship may attack as many times as it wants each attack step, but a player cannot choose to fire a weapon if doing so would cause that ship's weapon ⚡ to go below zero.

In addition to the number of dice it rolls, a weapon's  (shots) symbol indicates what firing arc it uses. Above, the green areas show the fighter-bomber's various firing arcs (they continue indefinitely). This manual uses "" to mean any of these.

Attacker Rolls Accuracy (~~✂~~): Count the number of hexes from the attacker to the target; this number will fall within one of the chosen weapon's ranges (see right). The attacking pilot rolls an amount of dice equal to the chosen weapon's shots (~~✂~~) and consults their ~~✂~~ number that corresponds to the current range. Each dice that rolls equal to or higher than that ~~✂~~ number is a "hit".

Left to Right: Short, Medium, and Long Range

Target Rolls Evasion (~~✂~~): Then, the player who controls the target rolls a number of dice equal to the number of hits. Each dice that rolls equal to or higher than the target's ~~✂~~ "evades" one hit.

Deal Damage: Each hit that was not evaded deals 1 damage to the target. For each damage, reduce the target's shields ⚡ by one. (Remember, if a ship would lose ⚡ but cannot because that system is at zero, it loses HP (⚡) equal to the remainder.) **NOTE:** If a ship's ⚡ goes to zero or lower, **DO NOT** immediately remove it, those ships are removed, simultaneously, in the next destroy step.

If a ship attacks while in the target's rear 60° arc, it is said to be "on the target's six". This means, for that attack, when the target rolls ~~✂~~, dice that rolled exactly ~~✂~~ do not evade any hits.

In the practice simulation to the right, the pilot of the red superiority fighter is scanning for targets with their main blasters. They cannot target the blue interceptor on the left because it is out of their weapon's arc (~~✂~~) nor the one on the right, as the asteroid tile blocks LOS.

It's a tricky shot, but they can target the green fighter-bomber, as it is in their weapon's arc, range, and LOS (shown as the green line). The target is 4 hexes away, which is medium range for the main blasters.

They elect to fire, spending 2 weapons energy (⚡⚡) and grabbing dice equal to the weapons shots (~~✂~~) value. In this case, it is 8. They squeeze the trigger, and roll the dice!

They rolled: ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~. Looking at their pilot's medium range accuracy (~~✂~~) they see it is 4+. So 4 of the dice are hits.

The target has an evasion (~~✂~~) of 5+. They roll a number of dice equal to the number of hits, in this case, 4. They roll ~~✂~~, ~~✂~~, ~~✂~~, ~~✂~~. Normally that would evade 2 of the 4 hits, but the attacker is on their six! That cancels the ~~✂~~, meaning they take 3 damage (4 hits minus 1 evade).

They have 1 shields ⚡. They reduce that to zero, and the remainder lowers their HP (⚡) by 2. They only had 1 left, so they will be destroyed in the coming destroy step. Luckily this was only a training simulation!

CUSTOMIZE YOUR GAME

This is your game! In addition to a balanced, competitive battle game, this box is meant to be a game system toolkit, allowing you to create your own battlefields, squadrons, scenarios ... really anything you want! In this chapter, we give several variants for terrain, objectives, and gameplay - but don't feel limited to this list! Crafting a battle based on a specific narrative, an innovative game mechanic, or a wacky science-fiction idea can really spice up the way the game is played. We sincerely hope Star Squadron sparks your inner game designer as well as your imagination ...

If not, that's great too! There's no wrong way to play, after all, this is your game!

OBJECTIVES

Objectives determine how the game is ended and who wins and who loses. Keep this in mind while playing, this is your ultimate goal! In the case that multiple players would win or lose at the same time, the player with the most total HP (🛡️) on their remaining ships is the victor. If this amount is the same for all players, play an additional round. If it is still the same after that round, the game is a draw. A player or team immediately wins if they destroy all their opponents ships. A player is said to “control” a terrain tile if that player has more of their ships on or within 2 hex of that tile than their opponent.

Battle: A player is immediately eliminated once 2 or 3 of their ships have been destroyed. In a team game, a team is eliminated once 4 (or more) of their ships have been destroyed.

VIP Battle: At the start of the game, each player designates one of their ships a VIP by placing a VP (👑) token on its ship board. If all the VIPs of a player/team are destroyed, then that player/team is eliminated. If, at any time, only VIPs remain, the game ends and the side with more remaining 🛡️ wins.

Conquest: At the end of each round, each side scores 1 🏆 tokens for each small terrain tile they control and 2 🏆 tokens for each large tile. For a medium length game, the first side to obtain 18 🏆 tokens (double for a team game) wins. You can set it to 12 🏆 for a shorter game or 24 🏆 for a longer one. If all the terrain tiles are somehow destroyed, the side with the most 🏆 tokens immediately wins. If, at the end of a round, both sides have surpassed the required number, the side with more overall 🏆 tokens wins. If both have the same, it is a draw.

Acquisition: At the start of the game, place 3 🏆 tokens on each small terrain tile and 5 on each large tile. At the end of a round, if a side controls a tile, that side takes 1 🏆 token from that tile. Once a tile has no 🏆 tokens on it, destroy it. The game ends when there are no terrain tiles remaining and the side with more 🏆 tokens wins.

TERRAIN VARIANTS

If all players agree, they can choose a terrain variant rule to play with, from those listed below:

Explosive: Terrain may be attacked like an enemy ship. Terrain has an evasion () of 6+ and 6 HP (). (Use a dice to track.) When a tile's  reaches zero, it is destroyed and removed during the destroy step. Any ships that were on or within 2 hex of that tile take 9 damage.

Chaotic: After the recharge phase, terrain moves randomly. For each tile, roll a dice twice. The first number determines the direction it will move, use the numbered arrows on the large terrain tile as a guide. The second determines the distance in hexes: move it half the number rolled, rounding down. Tiles may overlap; overlapping hexes count as one hex of that terrain type. If a tile moves completely off the map, it is immediately destroyed. For each terrain tile hex that moves under a ship, treat it as if that ship moved onto that hex.

Orbital: After the recharge phase, all terrain tiles move 4 hexes towards one of the shorter edges of the map. (Randomly determine which at the start of the game.) When the center hex of a tile moves off the map, place that center hex on the opposing hex (in the same row) along the other short end of the map, and it continues moving. For each hex that moves under a ship, treat it as if that ship moved onto that hex.

Translucent: If this terrain tile blocks LOS for a ship, that ship may still attack, as if the terrain tile was not there. If they attack in this way, they subtract 1 from all dice rolled in the  roll.

GAME MODES

The above rules explain how to set up and play Star Squadron in symmetrical mode. Symmetrical mode is a full, robust, and balanced play mode, and is not considered “basic” or “beginner”. For players who want a different experience, here are several other game modes. Note, most of these will increase the play time.

Asymmetrical: In this mode, each faction has unique abilities and resources. During setup, place your pilots with their ability text side up; these abilities are always active. When placing your ship cards, you may choose which side is placed up. The “Heavy Armor” side has more starting HP () , while the other side gets an ability token. (Find the matching token and place it on the ship card.) In addition, each ship gains one of their faction’s equipment tokens. Explanations and clarifications for these abilities and tokens are on the faction ability guide cards.

Draft: In this mode, faction loyalties have been lost to the ravages of war, and players take turns drafting their squadron. Roll off to determine whose turn is first. When it is a player’s turn, they choose one ship, pilot, or special weapon card, and add it to their squadron. They may choose any, regardless of type or faction, however, a player may not draft a fourth ship card, a sixth pilot card, or a seventh special weapon card. After all the cards have been drafted, they assemble their squadron from their drafted cards and play.

Power-Up: In this mode, scattered around the board are new abilities and equipment that players can gain. When setting up the board, take 2 random equipment tokens, 2 random ability tokens, and 2  tokens. Shuffle them and place them, face down, along the center row (longer line of hexes) of the game board. When a ship moves onto a token, reveal it, and that ship immediately gains that equipment or ability. If it is a  token, discard it and flip that ship’s pilot card over; it immediately gains its pilot ability.

Point-buy: In this mode, players start with a set number of upgrade points (UP) and may spend them when assembling their squadron, as shown on the upgrade chart to the right. Players jointly decide how many UP to begin with. Alternatively, players could decide randomly, rolling three dice and adding them together for the total.

Campaign: In this mode, squadrons keep some abilities and resources from game-to-game, growing in power as

you play. For your first game, setup as if playing symmetrical. After each game, players earn upgrade points (UP). If you won the game, gain 3 UP, otherwise, gain 2. Record these UP, they persist until you spend them. You can spend them on upgrades as shown on the upgrade chart. These upgrades are permanent. If they are somehow removed (like from the system damage variant) they are healed/repared at the start of the next game.

UPGRADE CHART

3 UP: Flip a pilot card, activating its ability.

2 UP: Flip a ship card, activating and gaining its ability token. This does not lower the ship's starting HP (⚔️). When setting up future games, use this ship's Heavy Armor starting ⚔️ amount.

1 UP: Increase the total number of equipment tokens your squadron can equip before a game by 1, to a maximum of 6. These tokens refresh between games and may be equipped to any ship(s) between games.

MORE THAN 2 PLAYERS

With multiple sets of Star Squadron, it is possible for 4, 6, or any even number of players to play together, either in a free-for-all or in teams. For each additional pair of players, add an additional game board adjacent to another, so they share one of the shorter edges. This will form a new column of hexes along the shared border. You can set up the same or different layouts on each board. When playing teams, teammates should start on the same side of the game board, so they can see each other's planned maneuvers. Teams perform their phases and steps simultaneously.

SYSTEM DAMAGE

A ship's HP (🚢) is an abstraction of the damage it takes from attacks and terrain - and when it loses enough, it explodes. If you'd like to introduce a rule that represents the actual damage/destruction of the various ship systems and equipment, simply do the following. When any ship's current 🚢 goes below 50% of its starting 🚢, turn its ship card sideways in its ship board. This is to remind you that in the next destroy phase that ship must roll on the system damage chart below, perform the result, then upright their ship card. A ship only rolls on this chart once per game, even if they manage to go above 50% 🚢 and then back below.

- 🎲: Weapons Hit! - Remove this ship's special weapon card, it cannot be used this game.
- 🎲: Engines Hit! - This ship immediately flames-out. If it was already flaming-out, there is no effect.
- 🎲: Energy Conduit Hit! - Roll a dice. This ship loses 2 ⚡ of: 🎲, 🎲: Weapons. 🎲, 🎲: Boost. 🎲, 🎲: Shields.
- 🎲: Injured Pilot! - Flip this ship's pilot card ability side down. It cannot use its ability for the remainder of this game. If it was already ability side down, roll again.
- 🎲: Computer Malfunction! - Flip this ship's ship card to its Heavy Armor side. It loses its ship ability token and cannot use it for the remainder of the game. If this ship was already Heavy Armor side up, it instead loses 2 🚢.
- 🎲: Lucky! - There is no effect.

FAQ

What if two abilities would happen at the same time? The players involved roll a dice. Whoever rolls higher (reroll ties) uses any abilities first, then their opponent has an opportunity to do the same.

What if I run out of dice? If you need to roll more dice than are available, roll as many as you can and record the results (like the number of hits or evades). Then roll the remaining needed dice and add their results to the recorded results.

Do modifiers affect things like “on you six!”? No. If a rule uses an image of a dice face (ie ) then only rolls of exactly that face will trigger it. For example, a ship with a +1 bonus to  rolls a . This counts as a 6, meaning it is an evade. If the attacker was on their six, it would still count as an evade, because it did not roll exactly a  face.

Can a dice be rerolled more than once? Yes, once per ability that says to.

Do I flame-out if I “go negative” on boost ⚡ from something other than performing a maneuver?: Yes.

How does attacking multiple targets at once work? The attacker rolls  only once and applies the results to all targets. Note, some results may hit some targets and not others, due to differing ranges. Then, each target rolls  against the number of hits they received.
